

ABSTRACT

2 Video, stills, panorama, sound and all forms of media as Rich Media in a Multimedia
3 Vehicle Repository (MVR) file editable with a Rich Media Content description file. The Rich
4 Media Content description file enables users to specify a vocabulary that defines the media
5 elements and relations among the media elements thereby permitting the users to easily create
6 and edit the Rich Media Content and compose various raw or compressed Rich Media
7 components using any text editor. A multimedia authoring server side processor accepts the raw
8 formatted Rich Media Content along with description text file in XML format and outputs the
9 Rich Media, text and graphic components as an edited MVR file in accordance with user's
10 design for execution on a multimedia player.
